AMERICAN BURYING BEETLE

Nicrophorus americanus
Federal Status: Endangered
Nebraska Status: Endangered

Photo by Doug Backlund

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since this species does not permanently occupy these locations and there are no elements of suitable habitat in these locations, there will be ***no effect*** on the species.	These activities occur in paved areas, areas previously disturbed by other activities related to the construction project, and generally in locations that do not support suitable habitat for the American Burying Beetle which are found in areas with little human development in prairie, forest edge and scrubland near Gothenburg, Brady, North Platte and the north-central grasslands of Nebraska. Since the species does not occur in the location of the activities, there will be ***no effect*** on the species.	Construction activities could impact the species through directly harming the animal, disturbing occupied or suitable habitat, or indirectly modifying habitat. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 2).	These bridge activities could result in materials falling from the bridge deck and debris removal which would impact the American Burying Beetle through directly harming the animal, disturbing occupied or suitable habitat, or indirectly modifying habitat. With implementation of the conservation condition, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 3)	Roadway lighting or night-time work with lights could disrupt nighttime activity of the American Burying Beetle by modifying breeding and/or foraging behaviors. With implementation of the conservation conditions, this activity ***may affect, but is not likely to adversely affect*** the species. (see Conservation Condition 4).	These activities ***may affect*** the species due to habitat modifications, direct takings, and/or habitat fragmentation and require consultation.

AMERICAN GINSENG

Panax quinquefolius
Federal Status: Not Listed
Nebraska Status: Threatened

Photo by Steve Nix, About Forestry

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck which does not support plant growth. Since these activities do not occur within suitable habitat for the American Ginseng, there will be ***no effect*** on the species.	These activities occur in paved areas, open water and bottomlands, areas previously disturbed by other construction activities, and generally in locations that do not support suitable habitat for the American Ginseng which occurs in oak-hickory forests. Since the activities do not occur in locations with suitable habitat, there will be ***no effect*** on the species.	Night-time work with lights does not directly Utilize or alter suitable habitat for the American Ginseng, and it does not directly or indirectly impact the species. Therefore, there will be ***no effect*** on the species.	These activities could disturb suitable habitat for the American Ginseng. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect the species*** (see Conservation Condition 1).	If these activities are restricted to the area between the hinge-points of the roadway, the activity will not occur in locations with suitable habitat for the American Ginseng because the area within the hinge point is non-natural ground with frequent disturbance. Work within the hinge point may proceed. If these activities occur outside the hinge-point, the activity could disturb suitable habitat. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 2).	These bridge activities could impact suitable habitat for American Ginseng, with possible effects of crushing plants or contaminating soils. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 2).	Habitat fragmentation could reduce the amount, size, or other aspect of habitat suitability for the American Ginseng. Reduction in habitat suitability ***may affect*** the species, and requires consultation.

BLACK-FOOTED FERRET

Federal Status: Endangered
Nebraska Status: Endangered

Photo by Jeff Vanuga, Corbis

EFFECTS and JUSTIFICATION

Effect Determination	ACTIVITIES	The scope of work for these activities is limited to the road surface/bridge deck. Since the Black-Footed Ferret does not permanently occupy these locations and there are no elements of suitable habitat in these locations, there will be ***no effect*** on the species.	These activities occur in streams and bottomlands, paved areas, urbanized locations, areas previously disturbed by other construction activities, and generally in locations that do not support suitable habitat for the Black-footed Ferret which is closely associated with prairie dogs, and found in short and mid-grass prairies. Since the species does not occur in the location of the activity, there will be ***no effect*** on the species.	These activities ***may affect*** the species due to habitat modifications, direct takings, lighting impacts, impacts to prey species, and/or habitat fragmentation and require consultation.

BLACKNOSE SHINER

Notropis heterolepis
Federal Status: Not Listed
Nebraska Status: Endangered

Photos by Carol Freeman

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since the Blacknosed Shiner does not occur in these locations, there will be ***no effect*** on the species.	These activities occur in paved areas, urbanized locations, uplands, large rivers, and generally in locations that do not support suitable habitat for the Blacknose Shiner which occurs in small freshwater creeks and shallow weedy areas of lakes and ponds in north-central Nebraska. Since the species does not occur in the location of the activities, there will be ***no effect*** on the species.	Night-time work with lights does not directly or indirectly impact this fish species. Therefore, there will be ***no effect*** on the species.	Construction of detention basins could result in erosion and sedimentation, and reduction in water quality for the Blacknose Shiner. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 1).	These bridge activities could result in materials falling from the bridge deck and impacting the Blacknose Shiner or its habitat. Therefore, this activity may affect the species. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 2)**.**	Ephemeral and intermittant channels may contain elements of suitable habitat within them. When the channel is dry, species will not be present, but channel modifications may convert suitable habitat characteristics of the channel to unsuitable habitat for use by the species when water is present. In addition, in-channel work may cause an increase in sedimentation or turbidity downstream of the site once water returns. Therefore, this activity may affect this species. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 3)**.**	Blacknose Shiner utilizes shrubby overhangs along creek banks. Construction activities may destroy or remove this type of vegetation, which may affect species habitat. Landscaping and revegetation involves reestablishment of upland vegetation in areas disturbed by construction, and the type of plants used may affect the species. With implementation of conservation conditions, potential impacts will be minimized; therefore, this ***activity may affect, but is not likely to adversely affect*** the species (see Conservation Condition 4)**.**	These activities could result in downstream erosion and sedimentation, and reduction in water quality for the Blacknose Shiner. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 5)**.**	These activities ***may affect*** the species due to habitat modifications, flow modifications, direct takings, and/or by increasing turbidity or sedimentation, and require consultation.

BLOWOUT PENSTEMON

Penstemon haydenii
Federal Status: Endangered
Nebraska Status: Endangered

Photo by Tim Griffin

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck which does not support plant growth. Since these activities do not occur within suitable habitat for the Blowout Penstemon, there will be ***no effect*** on the species.	These activities occur along stream courses and drainages, in paved areas, urbanized locations, areas previously disturbed by other construction activities, and/or generally in locations that do not support suitable habitat for the Blowout Penstemon which occurs in dry sandy blowouts. Since the activities do not occur in locations with suitable habitat, there will be ***no effect*** on the species.	Night-time work with lights does not directly utilize or alter suitable habitat for the Blowout Penstemon, and it does not directly or indirectly impact the species. Therefore, there will be ***no effect*** on the species.	These activities could disturb suitable habitat for the Blowout Penstemon. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect the species*** (see Conservation Condition 1).	These activities could indirectly affect the hydrology of the area and thereby affect the Blowout Penstemon. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 1).	These bridge activities could impact suitable habitat for Blowout Penstemon, with possible effects of crushing plants or contaminating soils. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 2).	Habitat fragmentation activities could reduce the amount, size, or other aspect of habitat suitability for the Blowout Penstemon. Reduction in habitat suitability ***may affect*** the species, and requires consultation.

COLORADO BUTTERFLY PLANT

Gaura neomexicana coloradensis
Federal Status: Endangered
Nebraska Status: Endangered

Photo by Georgia Doyle

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck which does not support plant growth. Since these activities do not occur within suitable habitat for the Colorado Butterfly Plant, there will be ***no effect*** on the species.	These activities occur in paved areas, open water, areas previously disturbed by other construction activities, and generally in locations that do not support suitable habitat for the Colorado Butterfly Plant which occurs in moist terraces adjacent to streams. Since the activities do not occur in locations with suitable habitat, there will be ***no effect*** on the species.	Night-time work with lights does not directly utilize or alter suitable habitat for the Colorado Butterfly Plant, and it does not directly or indirectly impact the species. Therefore, there will be ***no effect*** on the species.	These activities could disturb suitable habitat for the Colorado Butterfly Plant. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect the species*** (see Conservation Condition 1).	These activities could indirectly affect the hydrology of the area and thereby affect the Colorado Butterfly Plant. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 1).	These bridge activities could impact suitable habitat for Colorado Butterfly Plant, with possible effects of crushing plants or contaminating soils. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 2).	Habitat fragmentation activities could reduce the amount, size, or other aspect of habitat suitability for the Colorado Butterfly Plant. Reduction in habitat suitability ***may affect*** the species, and requires consultation.	Although an environmentally beneficial activity, if wetland mitigation occurs within suitable habitat for the Colorado Butterfly Plant, it could increase the water regime beyond the threshold level for the species. Since the activity ***may affect*** the species, consultation is required.

ESKIMO CURLEW

Numenius borealis
Federal Status: Endangered
Nebraska Status: Endangered

Photo by Gerrit Vyn

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since the Eskimo Curlew does not permanently occupy these locations and there are no elements of suitable habitat in these locations, there will be ***no effect*** on the species.	These activities occur in streams and bottomlands, paved areas, urbanized locations, areas previously disturbed by other construction activities, and generally in locations that do not support suitable habitat for the Eskimo Curlew which uses a variety of wetland and agricultural habitats, including newly tilled fields, burned prairies and marshes. Since the species does not occur in the location of the activity, there will be ***no effect*** on the species.	These activities ***may affect*** the species due to habitat modifications, direct takings, lighting impacts, and/or habitat fragmentation and require consultation.

FINESCALE DACE

Phoxinus neogaeus
Federal Status: Not Listed
Nebraska Status: Threatened

Photo by DaeMin Kim

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since the Finescale Dace does not occur in these locations, there will be ***no effect*** on the species.	These activities occur in paved areas, urbanized locations, uplands, large rivers, and generally in locations that do not support suitable habitat for the Finescale Dace which occurs in small freshwater creeks and shallow weedy areas of lakes and ponds in the central Sandhills of Nebraska. Since the species does not occur in the location of the activities, there will be ***no effect*** on the species.	Night-time work with lights does not directly or indirectly impact this fish species. Therefore, there will be ***no effect*** on the species.	Construction of detention basins could result in erosion and sedimentation, and reduction in water quality for the Finescale Dace. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 1).	These bridge activities could result in materials falling from the bridge deck and impacting the Finescale Dace or its habitat. Therefore, this activity may affect the species. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 2).	Ephemeral and intermittant channels may contain elements of suitable habitat within them. When the channel is dry, species will not be present, but channel modifications may convert suitable habitat characteristics of the channel to unsuitable habitat for use by the species when water is present. In addition, in-channel work may cause an increase in sedimentation or turbidity downstream of the site once water returns. Therefore, this activity may affect this species. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 3).	Finescale Dace utilizes shrubby overhangs along creek banks. Construction activities may destroy or remove this type of vegetation, which may affect species habitat. Landscaping and revegetation involves reestablishment of upland vegetation in areas disturbed by construction, and the type of plants used may affect the species. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 4).	These activities could result in downstream erosion and sedimentation, and reduction in water quality for the Finescale Dace. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 5).	These activities ***may affect*** the species due to habitat modifications, flow modifications, direct takings, and/or by increasing turbidity or sedimentation, and require consultation.

MOUNTAIN PLOVER

Charadrius montanus
Federal Status: Proposed Threatened
Nebraska Status: Threatened

Photo by Richard Ditch

EFFECTS and JUSTIFICATION

Effect Determination	ACTIVITIES	The scope of work for these activities is limited to the road surface/bridge deck. Since the Mountain Plover does not permanently occupy these locations and there are no elements of suitable habitat in these locations, there will be ***no effect*** on the species.	These activities occur in paved areas, urbanized locations, open water, and generally in locations that do not support suitable habitat for the Mountain Plover which inhabits arid shortgrass prairie, agricultural fields, areas of bare ground and prairie dog towns in the Kimball Grasslands and Panhandle Prairies of Nebraska. Since these activities do not occur in locations with suitable habitat, there will be ***no effect*** on the species.	These construction activities during nesting season create noise or human disturbance that could impact the species through directly harming the animal, disturbing breeding or foraging behaviors, disturbing occupied or suitable habitat, or indirectly modifying habitat. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 1).	Temporary or permanent lighting during the nesting season could impact the species through directly harming the animal, disturbing breeding behavior, disturbing occupied or suitable habitat, or indirectly modifying habitat. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 2).	Construction activities could create noise or disturbances for the species during construction/installation and impact the animal by disturbing breeding or foraging behaviors, or disturbing occupied habitat. Based on the short duration of activities and implementation of the conservation conditions , this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 3).	Survey and staking activities could create noise or disturbances within suitable habitat for the Mountain Plover that could impact the species through directly harming the animal, disturbing breeding or foraging behaviors, disturbing occupied or suitable habitat, or indirectly modifying habitat. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 4).	These activities ***may affect*** the species due to habitat modifications, direct takings, and/or habitat fragmentation and require consultation.

NORTHERN LONG-EARED BAT

Federal Status: Threatened

Nebraska Status: Threatened

Photo by USFWS

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since the NLEB does not permanently occupy these areas and they are not critical to the species life history, there will be ***no effect*** on the species.	NLEB inhabit deciduous woodlands (connected to ≥ 5 acres in size) that have live/dead tree species or snags that exhibit peeling bark, crevices or hollows (Typically ≥ 6-inch dbh) . These construction activities occur in open water, paved areas, areas previously disturbed by recent project activities (which were assessed through the matrix process), and in locations that do not support suitable habitat. Since the species does not occur in the location of the activity, there will be ***no effect*** on the species.	Construction activities could create noise or disturbances for the species during construction/installation and impact the animal by disturbing breeding or foraging behaviors and causing direct harm to the species and or hibernacula. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 1 or Conservation Condition 2).	These activities **may affect** the species due to habitat modifications, direct takings, and/or habitat fragmentation and require consultation.

PALLID STURGEON

Scaphirhynchus albus
Federal Status: Endangered
Nebraska Status: Endangered

Photo by Ken Bouc, Nebraska Game and Parks Commission

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since the Pallid Sturgeon does not occur in these locations, there will be ***no effect*** on the species.	These activities occur in paved areas, urbanized locations, uplands, ephmeral streams, and generally in locations that do not support suitable habitat for the Pallid Sturgeon which occurs in large silty rivers with a diversity of depths and velocities, and primarily in the Missouri and lower Platte Rivers in Nebraska. Since the species does not occur in the location of the activities, there will be ***no effect*** on the species.	Night-time work with lights does not directly or indirectly impact this fish species. Therefore, there will be ***no effect*** on the species.	Construction noise could disturb reproductive and foraging activities for the Pallid Sturgeon due to both vibratory and acoustical impacts. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 1).	Construction of detention basins could result in erosion and sedimentation, and reduction in water quality for the Pallid Sturgeon. With implementation of conservation conditions, potential impacts will be minimized; therefore, therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 2).	Disposal of drill cuttings within the river channel could result in erosion, sedimentation, and turbidity, which could directly take species through suffocation of larval sturgeon. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 3).	These bridge activities could result in materials falling from the bridge deck and directly taking or indirectly altering or contaminating its habitat. Therefore, this activity may affect the species. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 4).	Discharge of water or spoil into the river channel could result in erosion, sedimentation, and turbidity, which could directly take species through suffocation of larval sturgeon. These types of activities could also degrade suitable habitat. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 5).	Flow modifications or disturbances within the river channel could affect the amount and connectivity of suitable habitat for the Pallid Sturgeon. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 6).	These activities could result in downstream erosion and sedimentation, and reduction in water quality in suitable habitat for the Pallid Sturgeon. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect the species*** (see Conservation Condition 7).	These activities ***may affect*** the species due to habitat modifications, flow modifications, direct takings, and/or by increasing sedimentation, and require consultation.

RED KNOT

Calidris canutus rufa
Federal Status: Threatened
Nebraska Status: Threatened

Photo by USFWS

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since the Red Knot does not permanently occupy these locations and there are no elements of suitable habitat in these locations, there will be ***no effect*** on the species.	There is a slight possibility that these project activities may encounter migrating Red Knot during construction; however because of the ephemeral nature of this species, potential impacts are considered insignificant or dicountable and there is **not likely** to be an **adverse affect** on the species. ***NOTE** Because of the ephemeral nature of the occurrences of the species in the state of Nebraska, there are **no applicable conservation conditions at this time**.	These activities **may affect** the species due to habitat fragmentation and requires consultation.

RIVER OTTER

Federal Status: Not Listed
Nebraska Status: Threatened

Photo by Nicole Duplaix

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since the River Otter does not permanently occupy these locations and there are no elements of suitable habitat in these locations, there will be ***no effect*** on the species.	River Otters are typically found in river, stream, lake, pond, backwater, and wetland habitats. These activities occur in paved areas, urbanized locations, areas previously disturbed by other construction activities, and generally in locations that do not support suitable habitat for the River Otter. Therefore, these activities will have ***no effect*** on the species.	Construction activities could create noise or disturbance which may disrupt River Otter denning and foraging activities. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversly affect*** the species (see Conservation Condition 1).	The area within the hinge-point of a roadway does not contain River Otter foraging and denning habitat. Impacts to River Otter from activities occurring within this area are considered negligable and discountable. Activities occuring outside the hinge-point could disturb River Otter denning and foraging. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversly affect*** the species (see Conservation Condition 2).	These bridge activities could result in materials falling from the bridge deck and disturbing the River Otter through directly harming the animal, impacting the animal by disturbing breeding or foraging behaviors, or indirectly modifying habitat by the falling debris and debris removal. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 3)	These activities ***may affect*** the species due to habitat fragmentation and/or the modification of habitat and impacts to connectivity, and require consultation.

SALT CREEK TIGER BEETLE

Cicindela nevadica lincolniana
Federal Status: Endangered
Nebraska Status: Endangered

Photo by Robert Becker

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since this species does not permanently occupy these locations and there are no elements of suitable habitat in these locations, there will be ***no effect*** on the species.	These activities do not cause soil or vegetation disturbances. Since these activity types do not affect the species' habitat (which includes wet, un-vegetated mudflats or salt flats, and internal drainages and associated tributaries of Salt Creek and Little Salt Creek in Nebraska) or the species and does not change the existing habitat conditions, there will be ***no effect*** on the species.	These bridge activities could result in materials falling from the bridge deck and debris removal which would impact the Salt Creek Tiger Beetle through directly harming the animal, impacting the animal by disturbing breeding or foraging behaviors, or indirectly modifying habitat. With implementation of the conservation condition, the activity ***may affect, but is not likely to adversely affect*** the species. (see Conservation Condition 1)	These activities ***may affect*** the species due to habitat modifications, direct takings, nighttime lighting impacts, and/or habitat fragmentation and require consultation.

SALT CREEK TIGER BEETLE (Critical Habitat)

Cicindela nevadica lincolniana
Federal Status Endangered
Nebraska Status: Endangered

Photo by Robert Becker

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since these locations do not contain primary constituent elements of critical habitat, these activities will have ***no effect*** to designated critical habitat.	These activities do not cause soil or vegetation disturbances. Since these activity types do not affect primary constituent elements of critical habitat, there will be ***no effect*** to designated critical habitat.	These bridge activities could result in materials falling from the bridge deck and debris removal which would impact Salt Creek Tiger Beetle critical habitat through directly or indirectly modifying habitat. With implementation of the conservation condition, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 1)	These activities ***may affect*** the species due to habitat modifications, nighttime lighting impacts, and/or habitat fragmentation and require consultation.

SALTWORT

Salicornia rubra
Federal Status: Not Listed
Nebraska Status: Endangered

Photo by Chris Helzer, The Nature Conservancy

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck which does not support plant growth. Since these activities do not occur within suitable habitat for the Saltwort, there will be ***no effect*** on the species.	These activities occur in paved areas, open water, areas previously disturbed by other construction activities, and generally in locations that do not support suitable habitat for the Saltwort which occurs on salt flats of saline meadows in wet, clayey, highly saline soils. Since the activities do not occur in locations with suitable habitat, there will be ***no effect*** on the species.	Night-time work with lights does not directly utilize or alter suitable habitat for the Saltwort, and it does not directly or indirectly impact the species. Therefore, there will be ***no effect*** on the species.	These bridge activities could impact suitable habitat for the Saltwort, with the possible effects of crushing the plants or contaminating the soils. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 1).	These activities occur in salt flats, saline wetlands, or saline soils. Since the project area could support suitable habitat for the Saltwort, the activities ***may affect*** the species, and require consultation.

SCALESHELL MUSSEL

Leptodea leptodon
Federal Status: Endangered
Nebraska Status: Endangered

Photo by Dr. M.C. Barnhart

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since Scaleshell Mussel does not occur in these locations, there will be ***no effect*** on the species.	These activities occur in uplands and ephemeral streams, and generally in locations that do not support suitable habitat for the Scaleshell Mussel which occurs in medium to large unpolluted rivers with mud, sand or gravel substrate, and in the upper reach of the Missouri River in Nebraska . Since the species does not occur in the location of the activities, there will be ***no effect*** on the species.	These construction activities could physically disturb the Scaleshell Mussel by causing erosion and sedimentation, and suffocation; therefore these activities may affect the species. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 1).	These construction activities could result in erosion and sedimentation, and suffocation of the Scaleshell Mussel, therefore these activities may affect the species. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 2).	Barges and other equipment used in water can carry invasive aquatic species, including the Zebra Mussel which can starve and suffocate the Scaleshell Mussel by attaching to its shell in large numbers. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 3).	These bridge activities could result in materials falling from the bridge deck and directly taking the species or indirectly altering or contaminating habitat. Therefore, this activity may affect the species. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 4).	Discharge of water or spoil into the river channel could result in erosion and sedimentation, and suffocation of the Scaleshell Mussel. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 5).	These activities ***may affect*** critical habitat due to habitat modifications, flow modifications, direct takings, and/or by increasing turbidity or sedimentation, and require consultation.

SOUTHERN FLYING SQUIRREL

Federal Status: Not Listed
Nebraska Status: Threatened

Photo by Michael Patrikeev

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since the Southern Flying Squirrel does not permanently occupy these areas and they are not critical to the species life history, there will be ***no effect*** on the species.	The Southern Flying Squirrel is found in hardwood forests along the Missouri River in Nebraska. These activities occur in streams and bottomlands, paved areas, urbanized locations, areas previously disturbed by other construction activities, and generally in locations that do not support suitable habitat. Since the species does not occur in the location of the activity, there will be ***no effect*** on the species.	Construction activities could create noise or human disturbances for the Southern Flying Squirrel, which may cause them to abandon their denning cavities. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 1).	These activities involve reestablishment of vegetation in areas disturbed by construction, which could alter the habitat structure and species composition. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 2).	Roadway lighting or night-time work with lights could create disrupt night-time activities for the Southern Flying Squirrel. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 3).	These activities ***may affect*** the species due to habitat modifications, direct takings, and/or habitat fragmentation and require consultation.

SWIFT FOX

Federal Status: Not Listed
Nebraska Status: Endangered

Photo by Greg Lasley

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since the Swift fox does not permanently occupy these areas and they are not critical to the species life history, there will be ***no effect*** on the species.	Swift Fox inhabit shortgrass prairies and build their dens or occupy existing dens in loose soils on open prairies, along fences, or in tilled fields. These activities occur in open water, paved areas, areas previously disturbed by recent project activities (which were assessed through the matrix process), and in locations that do not support suitable habitat. Since the species does not occur in the location of the activity, there will be ***no effect*** on the species.	Construction activities could impact the species through directly harming the animal, impacting the animal by disturbing breeding or foraging behaviors, disturbance of occupied or suitable unoccupied dens, or indirectly modifying habitat. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 1).	Construction activities could create noise or disturbances for the species during construction/installation and impact the animal by disturbing breeding or foraging behaviors, or disturbing occupied dens. Based on the short duration of the activity and implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 2).	These activities ***may affect*** the species due to habitat modifications, direct takings, habitat fragmentation, and/or impacts to movement and to visual vantage points and require consultation.

TOPEKA SHINER

Notropis topeka
Federal Status: Endangered
Nebraska Status: Endangered

Photo from Kansas DW & P

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck. Since the Topeka Shiner does not occur in these locations, there will be ***no effect*** on the species.	These activities occur in paved areas, urbanized locations, uplands, large rivers, and generally in locations that do not support suitable habitat for the Topeka Shiner which occurs in small quiet clear prairie creeks or spring-fed pools in larger streams, in Cherry County wetlands and North Loup landscapes in Nebraska. Since the species does not occur in the location of the activities, there will be ***no effect*** on the species.	Night-time work with lights does not directly or indirectly impact this fish species. Therefore, there will be ***no effect*** on the species.	Construction of detention basins could result in erosion and sedimentation, and reduction in water quality for the Topeka Shiner. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 1)**.**	These bridge activities could result in materials falling from the bridge deck and impacting the Topeka Shiner or its habitat. Therefore, this activity may affect the species. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 2)**.**	Topeka Shiner utilizes shrubby overhangs along creek banks. Construction activities may destroy or remove this type of vegetation, which may affect species habitat. Landscaping and revegetation involves reestablishment of upland vegetation in areas disturbed by construction, and the type of plants used may affect the species. With implementation of conservation conditions, potential impacts will be minimized; therefore, this activity ***may affect, but is not likely to adversely affec*** t the species (see Conservation Condition 3).	These activities ***may affect*** the species due to habitat modifications, flow modifications, direct takings, and/or by increasing turbidity or sedimentation, and require consultation.

UTE LADIES'-TRESSES

Spiranthes diluvialis
Federal Status: Threatened
Nebraska Status: Threatened

Photo by Teresa Prendusi

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck which does not support plant growth. Since these activities do not occur within suitable habitat for the Ute Ladies'-Tresses, there will be ***no effect*** on the species.	These activities occur in open water, paved areas, urbanized locations, areas previously disturbed by other construction activities, and generally in locations that do not support suitable habitat for the Ute Ladies'-Tresses which occurs in sub-irrigated, somewhat alkaline, wet meadows. Since the activities do not occur in locations with suitable habitat, there will be ***no effect*** on the species.	Night-time work with lights does not directly utilize or alter suitable habitat for the Ute Ladies'-Tresses, and it does not directly or indirectly impact the species. Therefore, there will be ***no effect*** on the species.	These activities could disturb suitable habitat for the Ute Ladies'-Tresses. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 1).	These activities could indirectly affect the hydrology of the area and thereby affect the Ute Ladies'-Tresses. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 1).	If these activities are restricted to the area between the hinge-points of the roadway, the activity will not occur in locations with suitable habitat for the Ute Ladies'-Tresses, because the area within the hinge-point is non-natural ground with frequent disturbance. Work within the hinge-point may proceed. If these activities occur outside the hinge-point, the activity could disturb suitable habitat. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 2).	These bridge activities could impact suitable habitat for Ute Ladies'-Tresses, with the possible effects of crushing plants or contaminating soils. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 3).	Habitat fragmentation activities could reduce the amount, size, or other aspect of habitat suitability for the Ute Ladies'-Tresses. Reduction in habitat suitability ***may affect*** the species, and requires consultation.

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck which does not support plant growth. Since these activities do not occur within suitable habitat for the Western Prairie-Fringed Orchid, there will be ***no effect*** on the species.	These activities occur in open water, paved areas, urbanized locations, areas previously disturbed by other construction activities, and generally in locations that do not support suitable habitat for the Western Prairie-Fringed Orchid which occurs in wet to somewhat drier native prairies. Since the activities do not occur in locations with suitable habitat, there will be ***no effect*** on the species.	Night-time work with lights does not directly utilize or alter suitable habitat for the Western Prairie-Fringed Orchid, and it does not directly or indirectly impact the species. Therefore, there will be ***no effect*** on the species.	These activities could disturb suitable habitat for the Western Prairie-Fringed Orchid. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 1).	These activities could indirectly affect the hydrology of the area and thereby affect the Western Prairie Fringed Orchid. With implementation of conservation conditions, potential impacts will be minimized; therefore, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 1).	These bridge activities could impact suitable habitat for Western Prairie-Fringed Orchid, with the possible effects of crushing plants or contaminating soils. With implementation of conservation conditions, potential impacts will be minimized; therefore, the activity ***may affect, but is not likely to adversely affect*** the species (see Conservation Condition 2).	Habitat fragmentation activities could reduce the amount, size, or other aspect of habitat suitability for the Western Prairie-Fringed Orchid. Reduction in habitat suitability ***may affect*** the species, and requires consultation.

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	These project activities are limited to the road surface and either occur in urbanized areas, are of short duration, and/or do not involve a significant on-ground human presence. Therefore, there will be ***no effect*** on the species.	These construction activities may occur during migratory seasons, creating noise or human disturbance that could impact the species through directly harming the animal, disturbing staging, roosting or foraging behaviors, disturbing occupied or suitable habitat, or indirectly modifying habitat. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Conditions 1 or 2).	These activities involve reestablishment of vegetation in areas disturbed by construction. The establishment of non-native species, or species that are too tall, could alter habitat suitability for the Whoopong Crane, which prefers open areas with wide visibility. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect the species*** (see Conservation Condition 3).	These activities ***may affect*** the species due to habitat modifications, direct takings, and/or habitat fragmentation and require consultation.

WHOOPING CRANE (Critical Habitat)

Grus americana
Federal Status: Endangered
Nebraska Status: Endangered

Photo by Brian E. Small

EFFECTS and JUSTIFICATION

ACTIVITIES	Effect Determination	The scope of work for these activities is limited to the road surface/bridge deck, paved areas, and/or urbanized locations and generate temporary, minor levels of noise, which would not impact the functionality or intended conservation role of critical habitat. In addition, these activity areas do not contain primary constituent elements of critical habitat. Therefore, these activities will have ***no effect*** to designated critical habitat.	These construction activities could create noise or human disturbance during construction which may impact the primary constituent elements of critical habitat if the work occurs during the migration season. These activities, conducted outside the migration season, would not impact the functionality or intended conservation role of the critical habitat. With implementation of the conservation conditions, these activities ***may affect, but are not likely to affect*** designated critical habitat (see Conservation Condition 1).	These bridge activities could result in materials falling from the bridge deck and debris removal which would impact Whooping Crane critical habitat through directly or indirectly modifying habitat. With implementation of the conservation conditions, the activity ***may affect, but is not likely to adversely affect*** designated critical habitat (see Conservation Condition 2).	These activities involve reestablishment of vegetation in areas disturbed by construction. The establishment of non-native species, or species that are too tall, could alter habitat suitability for the Whoopong Crane, which prefers open areas with wide visibility. With implementation of the conservation conditions, these activities ***may affect, but are not likely to adversely affect*** the species (see Conservation Condition 3)	These activities ***may affect*** the species due to habitat modifications, nighttime lighting impacts, and/or habitat fragmentation and require consultation
