Audio Script and Notes to Reviewers

Welcome to Module Five. In this module, you will learn how to determine where to place noise barriers and analyze noise abatement measures.

Text Captions

Module 5: Evaluate Noise Abatement

You will be able to:

Evaluate Noise Abatement

- ◆ Determine where to place noise barriers
- ◆ Analyze traffic noise abatement measures

Determine Study Area Limits

- ◆ Define a traffic noise study area

Build the TNM

- ◆ Obtain data for noise analysis
- ◆ Identify noise-sensitive receptors
- ◆ Demonstrate modeling point placement

Validate the TNM

- ◆ Gather field noise measurements

- ◆ Validate the TNM
- Predict Noise Levels and Impacts
- ◆ Predict traffic noise levels and impacts
- Assess Construction Noise
- ◆ Evaluate and control construction noise
- Provide Information to Local Officials
- ◆ Provide information to local officials for undeveloped lands
- Prepare a Noise Report
- ◆ Prepare a noise report to NDOT standards

Slide 2 - Slide 2

Audio Script and Notes to Reviewers

Now that we know we will have traffic noise impacts, we need to complete noise abatement analysis for impacted receptors. The One-Hundred Level course identified the most common type of noise abatement.

Course 200: Traffic Noise Analysis Process
Evaluate Noise Abatement

Question 1 of 16

Knowledge Check

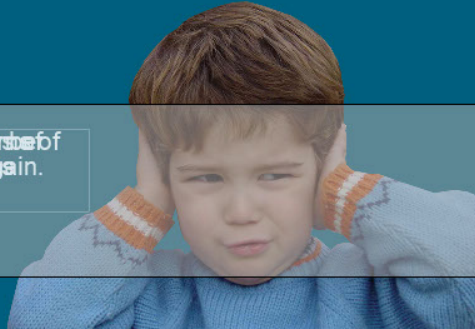

Do you recall from the 100 Level Course?
What is the most common type of noise abatement implemented by NDOT?

- Noise walls
- Vegetation
- Noise berms
- Quiet pavement

Submit

Review Area

Correct - Vegetation and quiet pavement are not acceptable forms of abatement. Noise berms are appropriate only if sufficient space is available and require NDOT approval. Noise walls are NDOT's preferred type of noise abatement. Click anywhere or click the Forward button to continue.

Audio Script and Notes to Reviewers

What is the most common type of noise abatement implemented by N-dot?

NOTE: We don't have an objective/master test question for this. Should we? If not, delete.

<p style="text-align: center;">Will</p> <h1 style="text-align: center; color: #f0e68c;">60%</h1> <p style="text-align: center;">of front-row impacted receptors located directly behind the noise wall achieve a</p> <h1 style="text-align: center; color: #f0e68c;">5 db(A)</h1> <p style="text-align: center;">reduction?</p> <p style="text-align: center; color: white; font-weight: bold; font-size: 2em;">YES</p>	<ul style="list-style-type: none"> <li style="margin-bottom: 10px;">✘ Can the barrier be designed to fit the topography and can existing / designed highway barriers still be maintained? <li style="margin-bottom: 10px;">✘ Can the exposed height of a noise barrier be built at 25 feet high or less? <li style="margin-bottom: 10px;">✘ Can the barrier: <ul style="list-style-type: none"> a) Be located beyond the clear recovery zone? b) Allow for sufficient sight distance at intersections? <div style="text-align: center; margin-top: 20px;"> ↓ </div> <p style="text-align: center; color: white; font-weight: bold;">If any of these items are checked</p> <h1 style="text-align: center; color: #e91e63; font-size: 2em; margin: 10px 0;">NO,</h1> <p style="text-align: center; color: white; font-weight: bold;">the site is not feasible.</p>

Audio Script and Notes to Reviewers

There are two components to feasibility: Acoustic and Engineering. When considering acoustic feasibility, ask if sixty percent of front-row impacted receptors located directly behind the noise wall will achieve a five D-B-A reduction. If the answer is yes, then consider engineering feasibility. Can the barrier be designed to fit the topography, and can any existing highway barriers still be maintained? Can the exposed height of a noise barrier be built at twenty-five feet high or less? If not, noise barriers beyond this height are typically not cost-effective and present structural and aesthetic considerations. Can the barrier address safety concerns? Can it be located beyond the clear recovery zone? And can it allow for sufficient sight distance at intersections? If any of these items are checked no, the site is not feasible.

Text Captions

FEASIBILITY: Can it be designed and constructed?

ACOUSTIC FEASIBILITY

Will 60% of front-row impacted receptors located directly behind the noise wall achieve a 5 db(A) reduction?

YES

ENGINEERING FEASIBILITY

Can the barrier be designed to fit the topography and can existing / designed highway barriers still be maintained?

Can the exposed height of a noise barrier be built at 25 feet high or less?

Can the barrier:

a) Be located beyond the clear recovery zone?

b) Allow for sufficient sight distance at intersections?

If any of these items are checked No, the site is not feasible.

Slide 20 - Slide 20

Course 200: Traffic Noise Analysis Process
Evaluate Noise Abatement

Analyze Abatement Measures

Acoustic Feasibility

Assuming the barrier achieves the minimum 5 dB(A) noise reduction, do those noise levels need to be below the impact threshold?

No. For example, in a residential area where the NDOT impact threshold is 66 dB(A)...

IMPACT THRESHOLD: 66 dB(A)

<ul style="list-style-type: none"> ◆ Predicted noise level: 76 dB(A) ◆ Noise barrier reduction by 5 dB(A) to 71 dB(A) ◆ Barrier IS considered acoustically feasible 	<ul style="list-style-type: none"> ◆ Predicted noise level: 68 dB(A) ◆ Noise barrier reduction by 3 dB(A) to 65 dB(A) ◆ Barrier is NOT considered acoustically feasible
--	--

Audio Script and Notes to Reviewers

Assuming the barrier achieves the minimum five D-B-A noise reduction, do those noise levels need to be below the impact threshold?

No. For example, assume we are working in a residential area where the N-dot impact threshold is sixty-six D-B-A and the predicted noise level is seventy-six D-B-A. The noise barrier is expected to result in a five D-B-A reduction to seventy-one D-B-A, which is above the sixty-six D-B-A specified as the N-dot impact threshold. However, the barrier in this example is considered acoustically feasible even though it does not reach the impact threshold. Conversely, assume the predicted noise level is sixty-eight D-B-A. The noise barrier is expected to result in a three D-B-A reduction to sixty-five D-B-A. Even though the resulting noise level would be below the N-dot impact threshold, the barrier does not meet the five D-B-A reduction required for noise barriers to be considered feasible.

Text Captions

Can the exposed height of a noise barrier be built at 25 feet high or less?

Can the barrier:

- a) Be located **beyond the clear recovery zone?**
- b) Allow for sufficient sight distance at intersections?

If the noise barrier cannot be placed outside the clear zone, design a safety barrier as part of the noise wall.

A noise barrier needs to be located outside the clear zone for safety reasons.

Audio Script and Notes to Reviewers

A noise barrier needs to be located outside the clear zone so that errant vehicles have sufficient opportunity to recover. This reduces the potential for collision with the noise wall. However, sometimes a noise barrier cannot be placed outside the clear zone because of site constraints, for instance along the edge of shoulder. In such cases, you must design a safety barrier, such as a guardrail or Jersey barrier, as part of the noise wall.

Analyze Abatement Measures *Engineering Feasibility*

Can the barrier be designed to fit the topography and can existing / designed highway barriers still be maintained?

Can the exposed height of a noise barrier be built at 25 feet high or less?

Can the barrier:

- Be located beyond the clear recovery zone?
- Allow for sufficient **sight distance** at intersections?

Do not locate a noise barrier within the intersection sight distance triangle for any approach.

Sight distance is the distance a motorist can see approaching vehicles before their line of sight is blocked by an obstruction such as a noise barrier.

Audio Script and Notes to Reviewers

Sight distance specific to intersections is typically the distance a motorist can see approaching vehicles before their line of sight is blocked by an obstruction, such as a noise barrier. Poor sight distance can increase the potential for crashes at intersections because motorists are unable to see and react to approaching vehicles. Therefore, do not locate a noise barrier within the intersection sight distance triangle for any approach. Coordinate with the roadway design team to determine if the proposed barrier maintains sufficient sight distance at intersections.

When is a traffic noise barrier considered acoustically feasible?

Correct feedback: Correct - Sixty percent of impacted receptors must achieve a 5 dB(A) reduction for a barrier to be considered acoustically feasible. Click anywhere or click the Forward button to continue.

1st incorrect feedback: Incorrect. More than half of impacted receptors must achieve a specific noise reduction. Click anywhere and try again.

2nd incorrect feedback: Incorrect - Sixty percent of impacted receptors must achieve a 5 dB(A) reduction for a barrier to be considered acoustically feasible. Click anywhere or click the Forward button to continue.

Slide 29 - Slide 29

Question 5 of 16

Knowledge Check

What three questions should you ask when considering engineering feasibility?
Select all answers that apply.

- Can the barrier be designed to fit the topography and existing barriers?
- Can the barrier exposed height be built at 25 feet high or less?
- Will the barrier need to be replaced?
- Will the barrier match designs of existing barriers?
- Will the barrier maintain the clear zone and provide sufficient sight distance?

Submit

Review Area

Correct Feedback: Correct - Engineering feasibility means the barrier can fit the topography, be built at less than 25 feet, and address safety by maintaining the clear zone and providing sufficient sight distance at intersections. Click anywhere or click the Forward button to continue.

Audio Script and Notes to Reviewers

What three questions should you ask when considering reasonableness?

Evaluate Noise Abatement

Question 6 of 16

Knowledge Check

Why was no guardrail or Jersey barrier included with this noise wall?

Submit

- It is located outside the clear zone.
- Guardrails and Jersey barriers are unsightly.
- The noise wall was reinforced with extra concrete.
- The adjacent receptors voted against it.

Correct. Only include guardrails or Jersey barriers if there is potential for vehicular collision with the noise wall. Click anywhere or click the Forward button to continue.

Audio Script and Notes to Reviewers

Why was no guardrail or Jersey barrier included with this noise wall?

Evaluate Noise Analysis Process
Module 2

Question 7 of 16

Knowledge Check

You determined that a barrier is not feasible. What is your next step?

- No further noise abatement analysis is required.
- Evaluate the barrier for reasonableness.
- Redesign the barrier with taller heights.
- Close any gaps in the barrier design for driveway and other access.

Submit

Correct - If a noise barrier is not deemed feasible, it will not be constructed. Therefore, there is no need to determine if it is reasonable. Click anywhere or click the Forward button to continue.

Audio Script and Notes to Reviewers

You determined that a barrier is not feasible. What is your next step?

You determined that a barrier is not feasible. What is your next step?

Correct feedback: Correct - If a noise barrier is not deemed feasible, it will not be constructed. Therefore, there is no need to determine if it is reasonable. Click anywhere or click the Forward button to continue.

1st incorrect feedback: Incorrect. If a noise barrier cannot meet acoustic or engineering requirements, there is no need to evaluate it further for noise reduction or cost-effectiveness. Click anywhere and try again.

2nd incorrect feedback: Incorrect - If a noise barrier is not deemed feasible, it will not be constructed. Therefore, there is no need to determine if it is reasonable. Click anywhere or click the Forward button to continue.

Slide 32 - Slide 32

Course 200: Traffic Noise Analysis Process
Evaluate Noise Abatement

REASONABLE: Will it be cost-effective?

Will

50%

of front-row impacted receptors achieve a

7 db(A)

reduction?

Determine cost-effectiveness:

- ◆ \$47 per square foot for barriers up to 16 feet high
- ◆ \$66 per square foot for barriers exceeding 16 feet and up to 25 feet high

Will the base value of abatement cost no more than \$37,000 per benefited receptor?

(Some adjustments up to \$52,000 per benefited receptor are allowed based on level of impact.)

If these items are checked

YES,

the barrier is reasonable.

Audio Script and Notes to Reviewers

If the site is feasible, then consider if it is reasonable. That is, can the barrier meet the noise reduction design goal at a reasonable cost? When considering reasonableness, ask if fifty percent of front-row impacted receptors will achieve a seven D-B-A reduction. If yes, determine if the barrier will be cost-effective. A reasonably-priced barrier is calculated using a unit cost of forty-seven dollars per square foot for barriers up to sixteen feet high. For barriers between seventeen and twenty-five feet high, a reasonably-priced barrier is calculated at sixty-six dollars per square foot. The base value of the abatement must cost no more than thirty-seven thousand dollars per benefited receptor. However, some adjustments up to fifty-two thousand dollars per benefited receptor are allowed based on level of impact. If all of these criteria are met, the barrier is considered reasonable.

Text Captions

REASONABLE: Will it be cost-effective?

Will 50% of front-row impacted receptors achieve a 7 db(A) reduction?

YES

Determine cost-effectiveness:

- ◆ \$47 per square foot for barriers up to 16 feet high
- ◆ \$66 per square foot for barriers exceeding 16 feet and up to 25 feet high

Will the base value of abatement cost no more than \$37,000 per benefited receptor?

(Some adjustments up to \$52,000 per benefited receptor are allowed based on level of impact.)

If these items are checked YES, the barrier is reasonable.

Reasonableness

A final barrier design allows for evaluating any design refinements. But not all refinements between preliminary and final design require additional noise modeling.

Coordinate with NDOT to determine the extent of analysis required during final design. Add any changes to the existing model.

Analyze Abatement Measures Reasonableness

In some cases, you might subdivide barrier lengths into smaller, ~20-foot-long segments.

This provides greater detail and opportunity to further refine the barrier heights.

Audio Script and Notes to Reviewers

In some cases, and in coordination with the N-dot Noise P-Q-S, you might subdivide barrier lengths into smaller, approximately twenty-foot-long segments. This provides greater detail and opportunity to further refine the barrier heights.

☐

Analyze Abatement Measures Reasonableness

A barrier of varying heights is more cost-effective than a barrier of continuous height. Transitions in height along the barrier length should also be smoothed to improve constructability.

Limit transitions between different barrier segments to 2 to 4 feet or less, if possible.

Course 200: Introduction to Analysis Process
Module 2

Question 9 of 16

Knowledge Check

When is a traffic noise barrier considered reasonable?
Select all that apply.

- When the barrier achieves a noise reduction goal of 7 dB(A) for 50% of benefited front-row receptors
- When the barrier achieves a noise reduction goal of 7 dB(A) for all benefited front-row receptors
- When the barrier is shown to be cost-effective
- When the barrier cost is within the project budget

Submit

Incorrect. The barrier must achieve a 7 dB(A) noise reduction goal for 50% of benefited front-row receptors and be cost-effective. Click anywhere or click the Forward button to continue.

Audio Script and Notes to Reviewers

When is a traffic noise barrier considered acoustically feasible?

Course 200: Traffic Noise Analysis Process
Evaluate Noise Abatement

Question 10 of 16

Knowledge Check

Why might you adjust the heights of barrier segments?

Submit

- To achieve maximum cost-effectiveness
- To improve the barrier's strength
- To improve aesthetics
- To accommodate overhead utility lines

Correct. A barrier with varying heights is usually the most cost-effective. Click anywhere or click the Forward button to continue.

Audio Script and Notes to Reviewers

Why might you adjust the heights of barrier segments?

Why might you adjust the heights of barrier segments?

Correct feedback: Correct - A barrier with varying heights is usually the most cost-effective. Click anywhere or click the Forward button to continue.

1st incorrect feedback: Incorrect. Varying barrier heights can save money overall. Click anywhere and try again.

2nd incorrect feedback: Incorrect - A barrier with varying heights is usually the most cost-effective. Click anywhere or click the Forward button to continue.

Slide 61 - Slide 61

Course 200: Traffic Noise Analysis Process
Evaluate Noise Abatement

Question 11 of 16

Knowledge Check

When adjusting barrier heights, to what height range should you limit the transitions?

- 2- to 4-foot transitions
- 5- to 10-foot transitions
- Less than 1-foot transitions
- Whatever the budget allows

Submit

Correct! Vary the transitions to 2 to 4 feet to improve constructability. Click anywhere or click the Forward button to continue.

Course 200: Traffic Noise Analysis Process
Evaluate Noise Abatement

Question 12 of 16

Knowledge Check

Which of the following statements about barrier cost-effectiveness are true?
Select all that apply.

- Costs include utility relocation, drainage control, and ROW acquisition unless otherwise avoidable.
- Costs do not include aesthetic treatments.
- Averaging several barriers together that would not otherwise meet the cost effectiveness criteria individually is not allowed.
- Barriers on either side of a street intersection are considered individual barriers and cannot be evaluated as single barrier.

Submit

Incorrect Feedback: Incorrect - These are all true statements regarding barrier cost-effectiveness. Click anywhere or click the Forward button to continue and try again.

Audio Script and Notes to Reviewers

Which of the following statements about barrier cost-effectiveness are true?

Select all that apply.

Correct feedback: Correct - These are all true statements regarding barrier cost-effectiveness. Click anywhere or click the Forward button to continue.

1st incorrect feedback: Incorrect. Costs related to physical elements in the study area can be included; most other approaches are allowable. Click anywhere and try again.

2nd incorrect feedback: Incorrect - These are all true statements regarding barrier cost-effectiveness. Click anywhere or click the Forward button to continue.

Slide 63 - Slide 63

Course 200: Traffic Noise Analysis Process
Evaluate Noise Abatement

Question 13 of 16

Knowledge Check

Which of the following statements about estimating barrier costs is true?
Select all that apply.

- Cost per square foot is the same regardless of height.
- Costs per square foot increase when barrier height is more than 16 feet.
- Some barriers may include segments both above and below a cost-change threshold.
- NDOT allows for adjustments if any receptor behind a noise barrier would experience a substantial increase in noise levels.

Submit

Review Area

Correct: Cost per square foot is not the same regardless of height. The remaining statements are all true. Click anywhere or click the Forward button to continue.

1st incorrect feedback: Incorrect. Costs can fluctuate with height, even throughout a barrier's entire length. In addition, allowable costs can fluctuate based on impacts to receptors. Click anywhere and try again.

2nd incorrect feedback: Incorrect - Cost per square foot is not the same regardless of height. The remaining statements are all true. Click anywhere or click the Forward button to continue.

Audio Script and Notes to Reviewers

Which of the following statements about estimating barrier costs is true?

Reviewer: Didn't have a specific objective about costs, didn't want to get into the details, but seemed like a general cost question was needed. Agree?

Slide 74 - Slide 74

Course 200: Traffic Noise Analysis Process
Evaluate Noise Abatement

That completes Module 5, Evaluate Noise Abatement. You learned how to determine if a noise barrier is feasible and reasonable, and where to place one.

Here's a quick summary. If you're ready to learn about construction noise, click the Forward button to continue to Module 6. Or use the Back button to review previous material first.

5

Evaluate Noise Abatement

- ◆ Barriers are most effective when they block the line of sight.
- ◆ Place barriers in close proximity to the noise source or the receptor.
- ◆ Benefiting every impacted noise sensitive receptor is not always possible.
- ◆ Noise reductions typically increase with increased barrier height and/or length. Strive to find the best balance between cost and benefit.
- ◆ A barrier with varying heights is often required to improve constructability.
- ◆ Evaluate barrier design for acoustic and engineering feasibility.
 - Noise abatement is acoustically feasible when 60 percent of the front-row impacted receptors located directly behind the noise wall achieve a minimum 5 dB(A) noise reduction.
 - Engineering feasibility considers topography and existing barriers, height, and safety.
- ◆ If a barrier is feasible, evaluate it for reasonableness.
- ◆ A reasonable barrier will achieve a noise reduction design goal and be cost-effective.
- ◆ For some projects, final barrier design may be required if project elements change.

Audio Script and Notes to Reviewers
