Interstate project

| 1 I-680 from Fort St to Irvington in Omaha | 6 lane interstate | \$29 | 1 | 84,080 | 0.285 |
| :---: | :---: | :---: | :---: | :---: | :---: |

Interchange project

## Crash Rate

The crash rate reflects on average, how many crashes are occurring per 100 million vehicle miles traveled

## Engineering Performance

This score takes into account safety, the amount of traffic, percent of cars and trucks, congestion travel time savings, vehicle operating costs, cost of improvement, and maintenance and operation costs of the roadway.

## Economic Performance

 This score is determined by measuring growth in jobs created, wage income, and gross state product.
## Overall Performance

Overall performance is calculated by combining the engineering score, weighted at $60 \%$, with the economic impact score, weighted at 40\%.

Example Packages totaling $\mathbf{\$ 2 7 5}$ million or less
Packages $A$ and $B$ are examples of combination of
projects and are provided for illustrative purposes. These packages are intended to foster discussion about options packages are intended to foster discussion about options for selecting projects. NDOR is interested in hearing your thoughts about these packages and your ideas for other combinations of projects.

| Package | Cost | Miles <br> Completed |
| :---: | :---: | :---: |
| A | $\$ 275$ | 146 |
| B | $\$ 273$ | 178 |

The engineering, economic and overall performance reflects the relativity of a project's score to all other projects statewide

Project scored in roughly the top 25 percent

- Project scored in roughly the middle hal

Project scored in roughly the bottom 25 percent
For both engineering and economic performance, scores were developed separately for rural and urban projects

## Crash Rate

The crash rate reflects on average, how many crashes are occurring per 100 million vehicle miles traveled

## Engineering Performance

This score takes into account safety, the amount of traffic, percent of cars and trucks, congestion, travel time savings, vehicle operating costs, cost of improvement, and maintenance and operation costs of the roadway.

## Economic Performance

 This score is determined by measuring growth in jobs created, wage income, and gross state product
## Overall Performance

Overall performance is calculated by combining the engineering score, weighted at 60\%, with the economic impact score, weighted at 40\%.

## Crash Rate

The crash rate reflects, on average, how many crashes are occurring per 100 million vehicle miles traveled.

## Engineering Performance

This score takes into account safety, the amount of traffic, percent of cars and trucks, congestion, travel time savings, vehicle operating costs, cost of improvement, and maintenance and operation costs of the roadway.

## Economic Performance

 This score is determined by measuring growth in jobs created, wage income, and gross state product.
## Overall Performance

Overall performance is calculated by combining the engineering score, weighted at $60 \%$, with the economic impact score, weighted at $40 \%$.

Completed

The engineering, economic and overall performance reflects the relativity of a project's score to all other projects statewide.

- Project scored in roughly the top 25 percent
- Project scored in roughly the middle half

Project scored in roughly the bottom 25 percent
For both engineering and economic performance, scores were developed separately for rural and urban projects

$$
\begin{array}{cc}
\text { Crash Rate } & \text { Engineering Performance } \\
